

Over 20,000 units distributed worldwide

More than the micron

CNC Retrofitting on older grinding machines

CNC – Everything in Movement

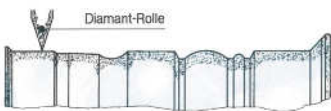

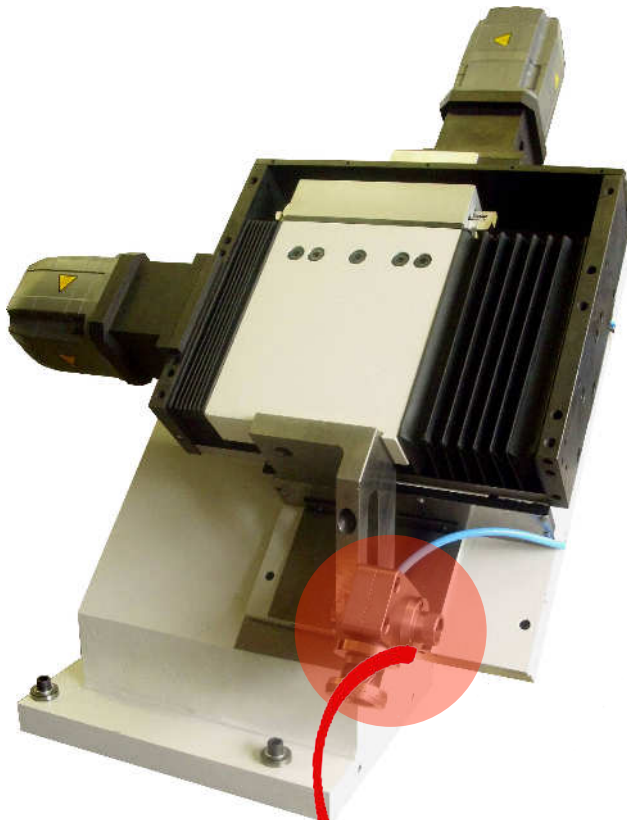

The machine axes produce most of the required grinding wheel profiles. As this is not always possible with older machines, we adapt continuous path controlled, stiff and vibration free CNC dressing units. Through that, complex and highly precise special shapes with precision of or under 0.001 mm are realizable, independent from the required methods. The challenge is, to use the available space, where a massive dressing unit with high stiffness is able to produce the required profile, interpolating.

The control can be integrated in the existing machine control or into a separate cabinet.

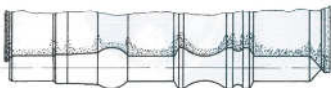

CNC dressing machines are already integrated into machines like:

- Schaudt
- Mikromat
- Lid-Köping
- Herminghausen
- and others
- König Bauer
- Famir
- Landis
- Nomoco
- Ghiringhelli
- Mikrosa
- Estarta
- Cincinnati

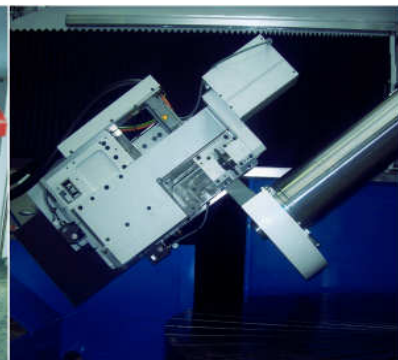

Available for every dressing application!
